

A place for papers

This is a real PDF, ready to travel between your devices.

Your app lives on GitHub Pages.

Your documents live in Google Drive.

A cached copy lives here, so you can keep reading offline.

Try it

Upload this sample to Drive. On another device, open Reading, connect the same Google account, then refresh the library.

Open this paper there. No MacBook or custom server is involved.

Assets, not settings

A paper is an asset: the complete PDF bytes, stored as a file.

A setting is small: a theme, a page number, or a reference to a file.

Those belong to different storage layers.

This prototype keeps originals unchanged.

It uploads new PDFs, lists the library, and downloads a local copy.

Reading position stays on this device for now.

The first step toward a research reading app:

a library you own, a clear connection, and a quiet place to read.
